

MOVEit® MuleSoft Connector

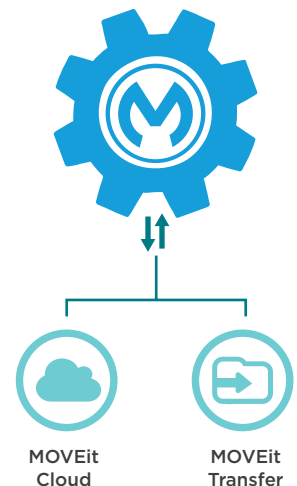

iPaaS Integration for Secure File Transfers

A unified API integration experience assuring compliant transfers of sensitive data between partners, customers, users and systems.

Mulesoft Integration

Progress has a MOVEit Transfer MuleSoft Connector to MuleSoft's Anypoint Exchange. This connector makes it simple for MuleSoft users to easily integrate secure managed file transfer capabilities into their Mule applications and lets them leverage the power of Progress MOVEit product family.

MOVEit Transfer keeps important files and data secure when information is at rest or in transit. It is ideal whenever you handle data that requires integrity checks, audit trails, or robust policies and controls needed to ensure confidentiality. From MuleSoft applications, the MOVEit connector can remotely interface with Progress MOVEit Transfer to perform a rich set of file operations. With MOVEit and MuleSoft you can integrate managed file transfer capabilities with any application supported by MuleSoft's iPaaS solution to meet business requirements.

Integration Example

An organization needs to develop a flow on the Anypoint Platform that transfers a file from an Amazon S3 bucket to the MOVEit Transfer Server, and notifies recipients via a Slack channel. The flow will be triggered by an HTTP request. This can be developed using either Anypoint Studio or Design Center.

The MOVEit MuleSoft Connector is available as a free download from the [MuleSoft Anypoint Exchange](#). For more information you can read the [MOVEit Mulesoft Connector user guide](#) or [contact us](#) directly.
